MC14451

OSCILLATOR/2¹¹ to 2¹⁹ DIVIDER/BUFFERED DUTY CYCLE CONTROL

The MC14451 consists of three sections: an oscillator, an 18-stage divider, and a buffered flip-flop for pulse width control and current sink drive. These circuits employ metal-gate complementary MOS devices for low-voltage operation and extremely low power dissipation.

A wide variety of output pulse widths and frequencies can be obtained using the pulse-width-control flip-flop. The number of combinations can be further increased by the variety of crystal frequencies or R-C networks used with the oscillator section.

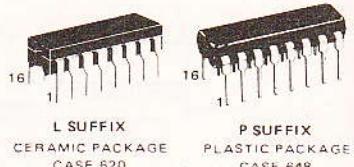

The buffered output of the duty-cycle-control flip-flop consists of an N-channel MOSFET for maximum current sinking capability and a P-channel active pullup device. Outputs from the 18-stage divider section provide a negative logic binary count.

Applications of the MC14451 include power-off timers, low-power-consumption timers especially suited for battery applications, elapsed timers, wall clocks, auto-timers for feeding systems, fuse timers, incubator timers, weather measurement equipment, and many other battery or low-power applications.

- On-Chip Duty Cycle Control
- Buffered Duty Cycle Control Output
- On-Chip Oscillator
- Low Power Consumption -20 μ W typical @ 1.5 Vdc and $f = 262$ kHz
- Operating Supply Voltage Range = 1.3 to 3.0 Vdc
- Diode Protection on Inputs

This device contains circuitry to protect the inputs against damage due to high static voltages or electrostatic fields. However, it is advised that normal precautions be taken to avoid application of any voltage higher than maximum rated voltages to this high impedance circuit. For proper operation it is recommended that V_{IN} and V_{OUT} be constrained to the range V_{SS} < V_{IN} or V_{OUT} < V_{DD}. Unused inputs must always be tied to an appropriate logic voltage level (e.g., either V_{SS} or V_{DD}).
